
Managed Security Services

Managed Firewall Provides the initial and essential network security functions to protect your hosted applications from unauthorized access and intrusion.

High-Availability (HA) Firewall Configuration Provides a fully redundant firewall with fail-over capabilities to protect your hosted applications from unauthorized access and intrusion.

High Availability (HA) Firewall Configuration with Load Balancing Provides a fully redundant firewall with both fail-over capabilities and load balancing to protect your hosted applications from unauthorized access and intrusion.

Managed Virtual Private Network (VPN) <- Firewall-to-Firewall – Client-to-Firewall Provides secured information transport over the Internet with the same capabilities as traditional leased lines but at a much lower cost.

VPN Bundle A VPN makes it possible to have sharing of public resources, at much lower cost by configuring dedicated tunnels using a shared public infrastructure like the internet. A switch to VPN connectivity leads to substantial reduction in long distance dial up and remote access server costs by taking advantage of flat rate Internet cost.

VPN Tunneling A VPN makes it possible to have sharing of public resources, at much lower cost by configuring dedicated tunnels using a shared public infrastructure like the Internet. VPNs offer business, government, and educational organizations flexible, secure, and cost-effective connectivity for their internal and external needs. This enables site-to-site intranets, access for remote users, and extranets.

Network-Based Intrusion Detection Services (Passive IDS) Monitors network traffic to help protect your network from hacker attacks that could disrupt your mission-critical systems and lower your customers' opinion and loyalty.

Host-Based Intrusion Detection Services (Active IDS) Monitors each server to help protect your network from hacker attacks and unapproved events that could disrupt your mission-critical systems and lower your customers' opinion and loyalty.

Token Authentication Provides an additional security level to protect your network from unauthorized access by using token-based authentication logon for remote clients or administrators.

O/S Policy Auditing Helps protect your system by identifying and correcting administrative configuration errors that could lead to system penetration by unauthorized users.

Remote Security Consulting Packages Helps you to achieve industry-specified security standards and service level requirements for your industry.

Managed PKI Authentication Services Provides an additional security level for remote clients or administrators by using digital certificate authentication.

Penetration Testing (This is an enhanced security feature). Penetration Testing is best described as ethical hacking. Fusion Labs performs scans and probes to assess, find and correct any weaknesses in the hosting shared infrastructure.
